

# eXactACCESS™

## Clinical Workflow Solution

eXactACCESS™ (“XA”) is an enterprise single sign-on and clinical workflow solution that addresses important healthcare challenges - workstation and data security, clinician adoption of CPOE and electronic documentation, and HIPAA compliance. XA is a client-server application that automates a single login to any

healthcare application, automates workflow to increase clinical productivity at shared workstations, and strengthens patient data security. XA’s application integration Wrappers manage application login and graceful log-off, check user credentials, automate password change events, auto-launch applications for users, navigate users directly to specific application screens based on their role(s), and can automate secondary authentication(s) within applications.

**XA** features include:

- 100% success with application integration. Unlike others, XA Wrappers both initiate and manage user interactions with applications, using a flexible framework that supports a variety of integration approaches
- Unique proximity badge functionality enables users to tap-in (login), tap-out (logout), tap-over (log another user out while simultaneously launching a unique session). Password-save timings (configurable) roll-over with each badge tap event. Users can self-enroll. Badge parity bits, bit count errors, and facility codes are checked for additional security

- XA automates unique user sessions and speeds user access to data within applications (auto-launching selected applications at login and auto-navigating users to specified pages within applications)
- Users can move between different computers and return to their work, exactly as they left it. XA was the first SSO solution to provide its users with Roaming SSO functionality. Building on this tradition of innovation, XA also roams published applications and even published applications within published desktops
- XA enables multiple people to share the same computer securely. Unique to HealthCast, XA has four client modes to tailor deployments to user workflow:
  - Kiosk mode (fast user-switching at the application level) speeds access to large applications
  - Multi-User mode (fast user-switching at the domain level) eliminates generic logins
  - eXpressACCESS (to lock down thick workstations and streamline access to published desktops)
  - Single-User mode for private workstationsEach mode can be roamed
- XA links live to Active Directory to automate user management and eliminate management of a duplicate credential store
- auditSERVER tracks user and workstation interactions and provides standard queries
- XA is designed with standards-based architecture to support current environments, thick and thin clients, and virtual desktop or server environments.

HealthCast is distinguished by its commitment to healthcare providers, the deep domain knowledge of its engineers and implementation teams, and its track record of success. **For more information, please contact:**
