

# Session Manager for Shared Workstations

## PrivateACCESS™

*“PrivateACCESS is on our mobile cart systems to improve HIPAA compliance and streamline workflow for our hospital customers.”*

*David Gulian  
President & CEO  
Infologix, Inc.*

PrivateACCESS is a standards-based solution that brings security and efficiency to shared workstations, creating unique desktop sessions for multiple users on the same workstation. Fast-User Switching at the domain level maintains unique open sessions behind a secure Privacy Shield so that users can leave a PC and return to their work exactly as they left it.

### USER BENEFITS

- Streamlined workflow - open sessions are maintained behind a secure Privacy Shield; returning users authenticate to gain access to their own session exactly as they left it
- Biometrics and other advanced authentication technologies can be added at any time for greater convenience
- More timely and complete documentation - users are returned to the point at which they were working when they were called away, so fewer notes go unfinished
- Efficient use of shared workstations - users can maintain open sessions to improve productivity
- Easy to use - users sign in with the domain username and passwords they already know and use
- Automated Privacy Shield isolates each user's work from the view of others and protects patient data privacy without changing the way clinicians work

### IT BENEFITS

- Unique fast-user switching for domain environments gives users quick and private access to their own resources (e.g., documents, mapped drives, network shares)
- Eliminates generic logins
- Configurable lock and logoff timings to support HIPAA compliance
- Automated privacy shield helps maintain patient data privacy
- No backend server requirements
- Easy to manage and deploy with standard technologies
- Can be upgraded to a full single sign-on deployment whenever convenient
