

HealthCast's Smart Single Sign-On

eXactACCESS

More than an enterprise solution, eXactACCESS (“XA”) is healthcare’s Smart SSO. While other SSO products end by passing a credential to an application, XA views this as the beginning. Whether navigating a user deep into an application based on role, maintaining multiple roaming sessions, saving work after configurable time-outs, or securely passing credentials, XA was designed to enhance clinical workflow while strengthening data security.

Why have hospitals made XA their ‘smart’ choice? First, HealthCast has a 100% success rate with application integration and creates true partnerships with its clients to optimize workflow and security. XA manages more than sign-on - auto-launching applications; taking users directly to specific screens; eliminating bottlenecks at shared workstations; interacting with applications to manage session suspension; gracefully backing out of screens; saving work, etc. And, XA has no proprietary hardware or new databases to manage, provides directory-based user management, and offers each hospital a choice of advanced authentication, identity management, or context management technologies.

eXactACCESS Success Stories

“This may be the best thing we’ve ever given our clinicians.”

“This was the smoothest deployment we’ve ever done.”

“XA allows me to give my full attention to my patients, and not fumble with passwords.”

“I wish all our vendors were as good partners as HealthCast.”

XA Speeds Physician Access to Patient Data

For a busy Emergency Medicine physician, time is key. Asking him to log-off 30-40 times a day as he leaves and returns to different workstations or to enter multiple passwords time and again is simply impossible to enforce - no matter what penalties the hospital faces or imposes. XA powerfully solved this dichotomy for one client with its HID card integration for access and log-off with configurable ‘password-save’ functionality. The result: Physicians swipe their cards to authenticate typically once a shift, access their data directly in 7-8 seconds (XA auto-launches the application and navigates the user directly to the desired screen), swipe their card to log-off, and then need only swipe their card to log-in as they return to any workstation.

XA Enables Nurses to Spend More Time with their Patients

Nurses spend more than 2 hours each day gathering and organizing patient data - precious time spent away from their patients. And, constant interruptions may also result in unfinished charting. For many hospitals, XA’s Roaming Sessions deployment (with Terminal Server or Citrix®) helps caregivers resolve these challenges and make the most of their time. With Roaming Sessions and XA’s configurable lock and log-off features, nurses can leave the workstation knowing that their work is secured, others can securely use the workstation in their absence, and each nurse can resume their session exactly where they left it at any supported workstation in the enterprise (across buildings, floors, etc.).

XA Balances Clinician Efficiency and Data Security

Balancing data privacy with clinician convenience and efficiency is the core of our Smart SSO. One regional hospital system used XA to gain this benefit for its 30+ busy physician offices and clinics. It deployed XA in Multi-User Mode with biometric authentication. In this mode, XA maintains unique active sessions for each user in each exam room. Automated Privacy Shields protect patient data privacy while clinicians move seamlessly between rooms opening their own active session in each room and going directly to patient data with only the touch of a fingerprint.
